# EveraCRAFT™ Craft/Micro Brewery Wastewater Treatment Systems

by Modular Water Systems™

Modular Water's packaged wastewater treatment systems for breweries are innovative, economical and are designed for the special treatment needs of brewery effluent.

Using high tolerance factory assembly under controlled conditions, our systems will reduce both installation and total cost of ownership. They are an ideal choice for microbreweries, brew pub / restaurants, commercial breweries, distilleries and wineries. Capacities range from less than 1,000 to over 20,000 gallons per day.

## Designed for Breweries + Lower Costs = The Ideal Solution

Wastewater from brewery processes contains sugars, alcohols and carbohydrates. Designing the treatment systems to handle this is a specialty of ours and we're proud of the efficient and cost-effective solutions we have been providing breweries.

Modular's packaged brewery wastewater treatment systems will reflect a total installed cost savings of 10% to 35% compared to mainstream, conventional wastewater treatment system design and construction.

These cost savings are possible due to their modular design, factory construction and fast installation. Our factory assembled systems are a complete package that significantly simplifies installation compared to systems constructed on-site.
